EDI Technical Documentation

EDIFACT Standard Version D96A

STORE CUSTOMER PURCHASE ORDERS MESSAGE

Version: 1.1

1. Overview

EDI (Electronic Data Interchange) is defined as the structured transmission of data between organizations by electronic means. It is used to transfer electronic documents such as Purchase Orders, Invoices, Advance Shipping Notices (ASNs), etc. from one computer system to another, i.e. from one trading partner to another trading partner. This specification provides the details of the **STORE CUSTOMER ORDER** message to be used in Electronic Data Interchange (EDI) in EDIFACT – Version D96 format between Operating Company and the Vendor.

ORDERS (Purchase Order) is a message sent from the buyer to the seller under agreed conditions. This specification guide provides the information of the purchase orders generated by the buyers for their vendors.

EDIFACT Version : D96A
EANCOM SUBSET: 008

2. Flow

PO – ASN – Invoice – Corrective Invoice

One store customer PO can have only one ASN and there should be one invoice per ASN. ASN should be sent before the actual delivery of the goods.

3. Segments Layout

The segments are presented in the sequence in which they appear in the message. The segment or segment group tag consists of Segment Name; Segment code; Status; maximum field lengths; maximum number of repeats of the segment/element and the details/descriptions to provide extra required information.

Descriptions which has been flagged as **Not Required**, highlights the elements/segment which is not used in our company.

There is various status of Data elements as per EANCOM standard, but we use only three statuses as (M)andatory / (C)onditional / (R)equired :

CODE	STATUS	USE
M	Mandatory	Code Indicator defines that the segment/element must be used.
C	Conditional	Code Indicator defines that the segment/element is optional. It can or cannot be used by the Vendors as per their own requirements.
R	Required	Code indicator defines that the segment /element is conditional as per the EDIFACT message standards, but the message information is mandatory only for the company.

4. Interchange structure and service segments

- The interchange structure in an EDIFACT transmission is organised in several grouping levels. The service segments are the envelope of the groups.
- The first service segment possible in an interchange is the 'UNA' segment which is used to define the separators being used in the interchange.
- The second service segment, "UNB", indicates the beginning of the interchange.
- The last service segment, "UNH", indicates the beginning of a given message.
- To each beginning service segment corresponds an ending service segment (note, UNA is not a beginning segment).

Service string advice:	UNA
Interchange envelope:	UNB UNZ
Message envelope:	UNH UNT

A segment consists of:

- A segment tag: identifies the segment type
- Data element separators
- Component Data elements
- A segment terminator

5. Separators

Apostrophe	'	=	segment terminator
Plus sign	+	=	segment tag and data element separator
Colon	:	=	component data element separator
Question Mark	?	=	release character; immediately preceding one of the service characters, it restores their normal meaning.

E.g. 10?+10=20 means 10+10=20

6. Conventions

The following conventions apply in the present documentation:

- a..3 up to 3 alphabetic characters
- n..3 up to 3 numeric characters
- an..3 up to 3 alpha-numeric characters

7. Segment Structure

All the service segments and the segment groups has been detailed in the below descriptions. An Example of an EDIFACT segment has been mentioned to identify the segment separators and the data values.

DTM+137:19940101:102'

- DTM = Tag of the "Date" segment;
- + = separator;
- 137 = Qualifier to indicate the date is the Message Date;
- : = separator of data elements within a composite (here, the date qualifier and the date);
- 20160101 = the date;
- : = separator of data elements within a composite (here, the date and the date format qualifier);
- 102 = Qualifier to indicate the format of the date (CCYYMMDD);
- ' = Segment terminator.

8. Message Structure Chart

Here collections of segments repeat as a group, which is mentioned as segment groups. **Number of Repeats** defines the number of times a segment or segment group may repeat. This structure is specific only for our company.

Technical Specification

Segments structure layer is defined as below:

9. Message Segment Details

This specification contains only the segment details for the messages. Other Segments (as per the GS1 EANCOM standard) which are not used in the Message has not been defined here. All the segments details have been listed in the same sequence they appear on the message. Specific Comments has been added in the Description column to clarify the requirements. It is advised to go through the Description column to understand the usage of each segment.

For some of the segments, the code has been fixed (as per the EDIFACT message standard codes) . This code has been defined with a tag name as **Default Value=** (code)

SEGMENT	SEGMENT NO.	SEGMENT NAME	M/C/R	PIC	DESCRIPTION	
UNA :			M			
	UNA1	+	Data element separator	M	an.1	Is used to separate two simple or composite data elements (Default value = +)
	UNA2		Decimal notation	M	an.1	Is used to indicate the character used for decimal notation (Default value = .)
	UNA3		Release character	M	an.1	Used to restore the separator and the terminator signs to their original specification (Default value= ?)
	UNA4		Reserved for future use	M	an.1	Default value = (space)
	UNA5		Segment terminator	M	an.1	Used to indicate the end of segment data (Default value = ')

Remarks:

This segment is used to inform the receiver of the interchange that a set of service string characters which are different to the default characters are being used.

Example:

UNA:+.? '
